Custom Seams in Angled Cable Guided Shades Application Note #405

048-405 REV A 10.20.09

Overview

When specifying custom seam location(s) in angled cable guided shades, the seams may not appear to line up properly with features external to the shade, such as mullions. For angled cable guided shades, the sag adds additional fabric to the total shade length, and the shade may sag away from the window by as much as two feet: this will change the locations of the seams with respect to the mullions. Additionally, slight variations in the angle of the shade at the installation can affect the amount of sag, further altering the seam location. Therefore, it is not recommended that seams be specified with the intent of lining up with external features. For additional information, see the diagram below.

Shade positioned vertically

Same shade positioned at an angle
